

What is Website?

A **website** is a collection of related web pages that are connected together and stored on a server. People can access these web pages through the Internet using a web browser like Chrome, Edge, Firefox, or Safari etc. Web Pages is written in markup language called "HTML".

Types of Website?

Lots of website categories is there but we can divide into two categories for easy understanding. which is —

1. Static Website

- Informative Website
- E-Catalogue Website
- Portfolio Website

2. Dynamic Website

- E-Commerce Website (Database)
- Blog Website (Database)
- Social Media Website (Database)
- Management Website (Database)
- Age Calculator (No Database)
- Language Translator (No Database)

What is Static Website?

Static Websites are made of "Fixed Code" and nothing will change on the web page until unless the site developer makes changes.

What is Dynamic Website?

A Dynamic Website changes its content and layout based on users action or data, making it more interactive.

What is Server/Web Server?

A Web Server is nothing but it's a huge compute system that store/hosts website and delivers web pages to 'users' or 'client'.

It handles incoming request, process them and send back (Serve) the appropriate content.

What is Client?

A Client is a device or application that sends a request to access a website or web application.

How a website works?

What is Domain Name?

A Domain name is user friendly address for a website that people search into their browser to visit the website like – `www.abodegraphics.com`

Areas of Web Development?

1. Front End Development/Front End Developer – (User Interface) HTML + CSS + JS

React/Angular (JS Library/Framework)

Bootstrap/Tailwind (CSS Framework)

2. Back End Development/Back End Developer – Java + Php + Node JS + .Net

3. Database Development /Database Developer – My SQL + Sql Server + Mongo DB (No SQL)

What is HTML?

HTML stands for Hyper Text Markup Language

It is the standard markup language for creating Web pages

It describes the structure of a Web page

HTML elements tell the browser how to display the content

(**.html** or .htm) is the file extension of a html page and first page of our website should be "index.html" so that we can understand this is our Landing Page.

Tags and Elements in HTML

It is an unique name or pre-defined name but enclosed with (<...> & </...>) angle brackets are called tag. ex- <h1></h1> or <p></p>

Note: Here <h1> Represent Opening Tag & </h1> Represent Closing Tag but in some cases, Some Tags has no any closing tags like — <input>
 <hr>

Such tags are self closing tags, Self-closing tags in HTML only have attributes and do not contain any content.

Elements are formed by tags and enclose with both the opening and closing tags along with the content. ex- <h1>This is Heading</h1>

Some Basic Tags:

<html> </html>	= html root
<head> </head>	= head section
<title> </title>	= title of website
<body> </body>	= body section

Basic Structure of HTML

```
<!DOCTYPE html>
<html>
  <head>
    <title>Abode Garphics</title>
  </head>
  <body>
    <h1>Introduction to Website Development Series</h1>
    <p><b>HTML - </b> This is First Lecture of HTML (Hyper Text Markup Language)</p>
  </body>
</html>
```

Conclusion

- `<!DOCTYPE html>` doctype declaration informs the web browser about the HTML version being used. The latest version is HTML5.
- `<html> </html>` tag is the root element that encapsulates all the content on the page.
- `<head> </head>` tag contains metadata and links to external resources like CSS and JavaScript files.
- `<title> </title>` tag sets the title of the web page, which is displayed in the browser's title bar or tab.
- `<body> </body>` tag contains the visible content of the web page. This is where text, images, and other elements go.

Some Basic Tags :

<code><html> </html></code>	= html root	<code> </code>	= lists
<code><head> </head></code>	= head section	<code><table> </table></code>	= table
<code><title> </title></code>	= title of website	<code><th> </th></code>	= table heading
<code><body> </body></code>	= body section	<code><td> </td></code>	= table data
<code><style> </style></code>	= add style/css	<code><tr> </tr></code>	= table row
<code><h1> </h1></code>	= heading	<code><script> </script></code>	= add js/javascript
<code><h2> </h2></code>	= heading	<code><a> </code>	= anchor/hyperlink
<code><h3> </h3></code>	= heading	<code><audio> </audio></code>	= add audio
<code><h4> </h4></code>	= heading	<code><video> </video></code>	= add video
<code><h5> </h5></code>	= heading	<code><div> </div></code>	= container
<code><h6> </h6></code>	= heading	<code> </code>	= inline container
<code><p> </p></code>	= paragraph	<code><header> </header></code>	= header section
<code> </code>	= unordered list	<code><footer> </footer></code>	= footer section
<code> </code>	= ordered list	<code></code>	= add image
<code><input> </input></code>	= input tag	<code><marquee> </marquee></code>	= text moving animation
<code><button> </button></code>	= add button		

Some Text Formatting Tags :

<code> </code> or <code> </code>	= Bold	<code><pre> </pre></code>	= Preformatted
<code><i> </i></code> or <code> </code>	= Italic	<code><blockquote> </blockquote></code>	= "
<code><u> </u></code>	= Underline	Some Other Tags & Short Key	
<code><s> </s></code>	= Strikethrough	<code><hr>
</code>	(Horizontal Rule & Break Line)
<code><sub> </sub></code>	= Subscript	<code>&nbsp;</code>	= Space/whitespace
<code><sup> </sup></code>	= Superscript	<code>&copy;</code>	= Copyright icon
<code><code> </code></code>	= Code	<code>&#9776;</code>	= Hamburger Menu icon
<code><mark> </mark></code>	= Marked/Highlighted	<code>&times;</code>	= close icon

Attributes in HTML.

- All HTML elements can have attributes
- Attributes provide additional information about elements
- Attributes are always specified in the start tag
- Attributes usually come in name/value pairs like : **name="value"**

For Example

```

```

```
<a href="https://www.youtube.com">Visit Youtube </a>
```

Conclusion

The **href** attribute of `<a>` specifies the URL of the page the link goes to

The **src** attribute of `<img>` specifies the path to the image to be displayed

The **width** and **height** attributes of `<img>` provide size information for images

Marquee Tag : Simple Scrolling Animated Text, basically uses for show notification or latest news highlights.

```
<marquee> Last Date for Application Submitting 25 July, 2024 </marquee>
```

Attributes to Add in Marquee

`bgcolor = ""red`

`direction = "top/down/left/right"`

`loop = "" or "3"`

`scrollamount = "10"`

`behavior = "alternate"`

`onMouseOver="this.stop()"`

`onMouseOut="this.start()"`

Anchor Tag in HTML:

Anchor tags in HTML used to create hyperlinks in webpages. They allow you to link to another webpage, a specific section of a page, an email address, a file, or any other URL.

For Ex- `<a href="www.wikipedia.com"> Wikipedia </a>`

You can use the **target="_blank"** attribute if you want your users to click on a link that opens up a new browser tab.

Ex- `<a href="www.wikipedia.com" target="_blank"> Wikipedia </a>`

Link in Image using Anchor Tag:

```
<a href="https://www.yourwebsiteaddress.com/"></a>
```

List in HTML

An HTML list is a record of related information used to display the data or any information on web pages in the **ordered** or **unordered** form.

So basically HTML Lists are two types.

Ordered List which is `<ol></ol>` : Lists have some sequentially bullet points (1,2,3 / a,b,c / ABC, i,ii,iii / I II)

Unordered List which is `<ul></ul>` : Lists have some un sequentially bullet points but in a shape (Circle, square, disc etc.)

`<ol></ol>` or `<ul></ul>` consists `<li></li>` tag and inside this we can add our text or our lists.

Ex:

```
<ol>
```

```
<li>HTML</li>
```

```
<li>CSS </li>
```

```
<li>Javascript</li>
```

```
</ol>
```

```
<ul>
```

```
<li>HTML</li>
```

```
<li>CSS </li>
```

```
<li>Javascript</li>
```

```
</ul>
```

Attributes for change bullet points:
